The valency of the recognition units important in determining specificity of interaction with WW domains In multivalent form specificity is relaxed, but not lost, so proteins containing WW domains similar, but not identical, to the sequence of peptides' target WW can be detected, including new polypeptides.                                                                                                                                                                                                                                                                           as such is useful in treatment of bacterial, mycoplasma and viral infections. It is also useful in treatment of diseases, eg. psoriasis, arthritis and asthma.

CDNA encoding a retinoblastoma (RB) associated protein (RAP), Apl2

CWAS cloned by direct screening of cDNA expression libraries using purified RB protein as probe. Apl2 showed transcription factor E2

CWAS cloned by direct screening of cDNA sequences were determined for Ap2 (067395, 067395, Ap8 (087397, 067398) and Ap15

CWAS cloned Ap10 (067601), which also encoded RB-associated
AU9347435-A.

New REI-Silencing Transcription factor (REST protein) - used therapeutically to control differentiation and activity of neural cells, e.g. in cases of brain cancer cells, e.g. in cases of brain cancer Claim 5; Page 40-42; 109p; English.

CA CDNA clone (T41404) codes for the DNA binding domain (R99364) of the human REST protein (see also R99355), or REI-silencing transcription factor, which inhibits expression of neural proteins in non-neural tissues by silencing promoters contg. REI elements (see also T41407). The cDNA sequence was derived from a full-length colone (T41406) coding for REST obtained. from HeLa cells. It can be used to produce REST DNA binding domain in transformed host cells, as a probe, and in gene therapy to treat conditions associated with excessive neural activity; antisense sequences can

This sequence encodes a novel member of the human regulator of G-protein signalling (RGS) gene family, RATHI1. The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

     Example 2; Figure 3; 21pp; English.

An in situ hybridisation assay for detecting an intracellular marker of low copy number in cells comprises fixing the cells to a support using paraformaldehyde; treating the cells with a protease to permeabilise them without altering morphology; adding amplification reagents; incubating the cells at below fifty degrees celsius to perform amplification by self-sustained sequence replication; adding a labelled probe complementary to the region between the primers;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       E6/E7 region of Human Papilloma Virus 16 (HPV 16).

                                                                                                  PT Recombinant virus vectors encoding human papillomavirus proteins presented by them, such as cervical cancer productions caused by them, such as cervical cancer productions caused by them, such as cervical cancer productions caused by them, such as cervical cancer products as a site for low plasmid pBR322/HPV16 (Durst et al., PNAS, 80: CC prepd. by PCR from plasmid pBR322/HPV16 (Durst et al., PNAS, 80: CC prepd. by PCR from plasmid pBR322/HPV16 (Durst et al., PNAS, 80: CC prepd. by PCR from plasmid pBR322/HPV16 (Durst et al., PNAS, 80: CC prepd. by sing oligonucleotides SO5 and SO6. The DNA prod. has a site for NcoI at the beginning of the E6 gene and a SmaI site commediately downstream of the termination codon for E7. The E6 and CC immediately downstream of the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of the PV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the formune system against HPV. See also Q23385-400 and Q29450-69.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                          PT assessed for enzyme expression
PS Example 1; Page 83-84; 112pp; English.

CC The present sequence encodes a modified beta-lactamase (BL) used to CC exemplify the present invention. The present invention describes a method for identifying proteins or chemicals that directly or indirectly comodulate a genomic nucleic acid. The method comprises treating a living cell, which contains a BL-expressing construct integrated into a cell, which contains a BL-expressing construct integrated into a compound, then detecting BL activity in the cell. The method is used to identify chemicals such as drugs which are potentially used to treat immune responses; cardiac, vascular, neural, endocrine or gastrointestinal disorders; diabetes; obesity; inflammation; cancer and crauma. Generally the method is used to identify used to treat compound. The genome; modulators of these regions and cellular regions of the genome; modulators of these regions and cellular compounds. Measurement of BL provides rapid, in vivo, identification/ CC pathways. Measurement of BL provides rapid, in vivo, identification/ CC processes, and characterisation of these can be done in the same cells correction sustems.

The present sequence encodes a modified beta-lactamase (BL) used to method for identifying proteins or chemicals that directly or indirectly modulate a genomic nucleic acid. The method comprises treating a living cell, which contains a BL-expressing construct integrated into a non-yeast eukaryotic genome, with a predetermined concentration of test compound, then detecting BL activity in the cell. The method is used to identify chemicals such as drugs which are potentially used to treat immune responses; cardiac, vascular, neural, endocrine or immune Generally the method is used to identify chemicals such as drugs which are potentially used to treat or gramma. Generally the method is used to identify useful/functional regions of the genome; modulators of these regions and cellular or pathways. Measurement of BL provides rapid, in vivo, identification/ pathways. Measurement of BL provides rapid, in vivo, identification/ pathways. Measurement of BL provides rapid, in vivo, identification/ pathways. Measurement of BL provides rapid, in vivo, identification/ pathways. PT comprising a starting enzyme in which a mimetope is inserted to bind
PT a binding molecule to modulate the activity of the enzyme
PS Example 1; Fig 1B; 6)pp; English.

CC This sequence encodes a beta-lactamase fragment that can be used in the
CC chimeric enzyme (CE) of the invention. The CE comprises: (a) a starting
CC enzyme which is a polypeptide; and (b) a mimotope comprising at least one
CC amino acid, which mimotope is inserted into the starting enzyme or which
CC replacement yielding the CE which has an enzymatic activity of the:
CC starting enzyme and the activity of the CE is modulated upon binding of a
CC modulate the catalysis of a substrate by the CEs. The CEs can be used for
CC the detection of BMs which can be analytes such as an antibody specific
CC cerbB2, products of oncogenes, virus (e.g. HIV or hepatitis), or
CC cercia (e.g. Staphylococcus). Alternatively the CEs can be used for the
CC detection of ligands of the BMs.

It may be of particular (use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences that are potential sources of control elements for bacterial gene expression. Detecting a sequence encoding the protein (can be used diagnostically, e.g. to detect a mutation for serotyping or classifying infectious agents.

DNA coding for prolactin - obtd. by prepn. or reverse common for prolactin and inserting into a transfer vector. Claim 12: Fig 3: 10pp; English.
The cDNA was prepd. from RNA extracted from prolactin secreting tumours obtd. after surgical removal. The sequence can be inserted into expression vectors for the prodn. of prolactin which can be admin. to dairy cows to increase milk yield. It can also be used admin.
                                                                                                                                                                                                                                                                                                                                                                                                                          N80115
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated uropathogenic E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to elicit an immune response to pathogenic E. coli clid immune response to pathogenic E. coli strain J96 contig containing pathogenicity island (PAI) sequences, and represents a nucleic acid molecule of the invention. PAIs are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI V. PAI IV is located at approximately 64 min (near phev) on the E. coli chromosome and is greater than 170 kb. PAI V is located at approximately 94 min (at pheR) on the E. coli chromosome and is greater than proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-OCT-1998 (first entry)

CC An expression cassette which contains the alcohol oxidase promoter CC is induced when in the presence of methanol/glycerol. Under such CC conditions any heterologous gene located downstream of the promoter CC will be expressed. The expression cassette can be used to construct an expression vector which in turn can be used to transform cells. CC When transformed cells are cultured in the presence of methanol/ CC glycerol expression of the heterologous gene is induced such that CC large quantities of the desired product is produced. The CC large quantities of the desired product is produced. The CC craymes such as adenylate kinases, cytochrome C and peroxidases. CC The autonomously replicating sequence is used in the construction CC of the expression vector, conferring the ability of replication CC on the expression vector.

DNA encoding maize acetyl coenzyme A carboxylase gene - used for prodn. of plants with herbicide tolerance or altered oil content claim 2; Page 92; 131pp; English.
6 Genomic DNA fragments (T39908-13) of maize Type A2 acetyl CoA carboxylase (ACCase) were isolated from a B37 genomic library by screening with a 2 kb subclone of cDNA clone #15-14 (see also T39904). Type A1 (see also T39904). Type A1 (see also T39904). Type A1 (see also T3904) by and Type B (T39914-16) genomic clones and a full-length cDNA clone (T39905) for ACCase (W05590) have also been obtd. ACCase sequences can be incorporated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               28-FEB-1992; JP-043361.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                            PI assessed for enzyme expression

Example 1; Page 80-81; 112pp; English.

CC The present sequence encodes a modified beta-lactamase (BL) used to CC exemplify the present invention. The present invention describes a cc method for identifying proteins or chemicals that directly or indirectly comodulate a genomic nucleic acid. The method comprises treating a living CC enll, which contains a BL-expressing construct integrated into a cc non-yeast eukaryotic genome, with a predetermined concentration of test compound, then detecting BL activity in the cell. The method is used to identify chemicals such as drugs which are potentially used to treat cast cidentify chemicals such as drugs which are potentially used to treat compound, then detecting BL activity in flammation; cancer and crauma. Generally the method is used to identify useful/functional cregions of the genome; modulators of these regions and cellular regions of the genome; modulators of these regions and cellular completelis or chemicals associated with particular biological componence and characterisation of these can be done in the same cells componence and characterisation of these can be done in the same cells componence and characterisation of these can be done in the same cells contended to the same cells co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 100.0%;

                                                                                                                                                                                    PT New isolated human genes and the secreted polypeptide(s) they encode provided for diagnosis and treatment of e.g. cancers, neurological providers, immune diseases, inflammation or blood disorders claim i, page 312; 721pp; English.

CC that in 1; page 312; 721pp; English.

CC the human cDNA clone HMMDN32 (deposited as clone ATCC 97900 and ATCC CC 209046) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin CC portion (e.g. V95902) for increasing the stability of the fused CC protein as compared to the human protein only.

CC The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V5951-V59812; amino acid sequences W74731-W75026) which care useful for preventing, treating or ameliorating medical conditions ce.g. by protein or gene therapy. Also, pathological conditions can be CC diagnosed by determining the amount of the new polypeptides in a sample CC or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V59511 for described constitutions).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9R 16-JUL-1997; US-0551925.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 7; Fig 7D; 112pp; English.

Example 7; Fig 7D; 112pp; English.

CC This is the Type A2 ACCase genomic clone D partial nucleotide resistant corn CC This invention provides methods of preparing an herbicide resistant corn CC plant which comprises crossing a first corn plant to a second corn plant CC plant which comprises crossing a first corn plant to a second corn plant CC consistant allele and the second plant comprises at CC least 1 herbicide resistant allele which is not allelic to the herbicide resistant allele present in the first plant. The herbicide resistant corn CC plants are prepared using Accl and Acc2 gene combinations which impart CC cylcohexanedione (CHD) or aryloxyphenoxypropanoic acid (APA) herbicide tolerance to the corn plants and to produce CHD or APA herbicide tolerance to corn plants and to produce CHD or APA herbicide CC tolerant Zea mays (corn) homozygous or heterozygous for Acc2. The methods can also be used to CC carboxylase, selected from 3-(2,4-dichlorophenyl)-perhydroindolizine-2, CC candon, 3-isopropyl-6-(N-(2,2-dimethylpropyl)-acetamido-1,3,5-triazine CC -2,4 (1H,3H)dione, soraphen A and their structural analogues.

It was used to examine expression of MCCS1 (see also W19723-24) mRNA and protein in normal and irradiated mouse testes and in mouse embryos by in situ hybridisation. In both normal and irradiated mouse testes signal was observed in the cytoplasm of spermatogonia and spermatocytes. The expression level in irradiated testis was not increased over that seen in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pBR322

PT Genes involved in viral infection and tumour suppression - used to pri develop products for reducing or preventing viral infection or for suppressing tumours for reducing or preventing viral infection or for PT suppressing tumours for reducing or preventing viral infection gene. The present control of the sequence represents a viral infection gene. The present control of the invention comprise 70 viral infection (VI) genes and control of the invention comprise 70 viral infection (VI) genes and control of the serum protein (SP) allows selective elimination of cells control of the serum protein (SP) allows selective elimination of cells control of the serum protein (SP) allows selective elimination of cells control of the SP can be used for reducing or inhibiting a viral infection. Control of the TS gene products can be used to suppress a malignant control of the TS gene products can be used with viruse such as similar immunodeficiency virus, hepatitis virus or animal retroviruses such as communodeficiency virus, feline immunodeficiency virus, sequine infectious anemia virus, caprine arthritis encephalitis virus or visna virus.

Control of the identified genes are non-essential to cell survival, the control of the inventor of the control of the

useful for diagnosis, treatment and prevention of e.g. cancer,
cystic fibrosis, diabetes etc.
Claim 22: Fig 2: 69pp; English
The human p24 vesicle-trafficking proteins and agonists, optionally
expressed in vivo from, are used to treat or prevent diseases associated
with abnormal vesicle trafficking, including endocrinal, secretory,
inflammatory or gastrointestinal disorders. Antagonists of human
p24, e.g. antisense nucleic acid, ribozymes, triplex-forming molecules,
antibodies, are used to treat or prevent cancers. Antibodies may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Viral infection gene SEQ ID NO:63.

PT against influenza A and B
PS Example 10; Page 112; 151pp; English.

CA vaccine comprising an immunogenic fragment of the HA2 subunit of
CC the influenza haemagglutinin (HA) protein from type A subtype IV and
CC type B IV may be used for stimulating protection in animals against
CC injection with influenza virus. The vaccine confers multi-strain
CC immunity against strains IV A and IV B. The vaccines multi-strain
CC recombinantly produced, optionally as fusion proteins. NOTE: This
CS equence is a modified version of the sequence given in 070190,
CC having cytosine at positions 622, 625 and 634 instead of adenine, and
CC having thymine at positions 624, 627 and 636 instead of guanine.
CC These alterations are silent mutations i.e. the encoded polypeptide
CC the encoded H3HA2 protein.

                                                                                        The present sequence represents a viral infection gene. The present CC invention describes nucleic acid sequences isolated from rat. The CC invention describes nucleic acid sequences isolated from rat. The CC sequences of the invention comprise 70 viral infection (VI) genes and CC absence of the serum protein (SP) allows selective elimination of cells cabsence of the serum protein (SP) allows selective elimination of cells cersistently infected with a virus from the cell culture. Inhibitors of the SP can be used for reducing or inhibiting a viral infection.

CC inhibitors of the TS gene products can be used to suppress a malignant cert of the SP gene products can be used with viruses such as HIV, influenza, hepatitis virus or animal retroviruses such as communodeficiency virus, avian immunodeficiency virus, bovine communodeficiency virus, feline immunodeficiency virus, equine infectious anemia virus, caprine arthritis encephalitis virus or visua virus.

CC because the identified genes are non-essential to cell survival, the creatment methods can be used in subjects without serious detrimental celeficits to the subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Vaccines against multi strain influenza virus insection.

against influenza A and B

Glaim 23; Page 63-64; 151pp; English.

A vaccine comprising an immunogenic fragment of the HA2 subunit of the influenza haemagglutinin (HA) protein from type A subtype IV and type B IV may be used for stimulating protection in animals against injection with influenza virus. The vaccine confers multi-strain immunity against strains IV A and IV B. The vaccines may be recombinantly produced, optionally as fusion proteins.

recombinantly produced, optionally as fusion proteins.

The CC bbk gene was identified using a yeast two hybrid system in which a CC GAL4 DNA binding domain/Bak fusion protein was used as the bait to cisolate Bak interacting proteins expressed as GAL4 activation cC domain fusions generated from a CDNA library of Epstein-Barr virus cransformed human B lymphocytes. The Bbk protein and its BH3 domain CC peptide (see W38346) can be used to induce apoptosis in non-apoptotic cells, useful in the treatment of degenerative disorders characterised by inappropriate cell death, e.g. Alzheimer's disease, cc tissue hypertrophy and inflammatory disorders. They may be administered with a carrier, e.g. tissue specific receptor, or cc preferably via a viral vector or liposome, in the form of an cc claimed, as well as a labelled nucleotide probe that can be used cc unth the expression of Bbk.

                                                            Transformed plant producing animal-derived anti-virus antibody easp. tobacco plants producing anti-tobacco mosaic virus monocional antibody

monocional antibody

Example 2; Pages 13-14; 26pp; Japanese.

Example 2; Pages 13-14; 26pp; Japanese.

O79929 and 079930 encode R66757 and R66758, the light and heavy chains of an animal derived anti-tobacco mosaic virus (TMV) monocional antibody. The cONAs were incorporated into a Ti plasmid vector, which was incorporated into A. tumefaciens. The resultant plant expression vector was used to transform tobacco plants, making them TMV resistant, the plants could also be biofarmed for the prodn. of anti-virus antibodies.                                                                                                                                                                                                                                                                                                           PT Identification of cows giving high milk yields on basis of PT Identification of cows giving high milk yields on basis of PT Identification of exon 6 of PT-1 gene

SClaim 6; Fig 4; 22pp; English.

CC This sequence represents exon 6 of the bovine pituitary derived PTT-1 gene, showing the HinfI polymorphic site. This sequence was amplified CC using the primers given in T68930-31 for detecting the HinfI CC using the primers given in T68930-31 for detecting the HinfI CC using the primers given in T68930-31 for detecting the HinfI CC a genetype indicative of high milk production. The method comprises CC obtaining a nucleic acid sample from the bovine and ascertaining that CC the base at nuclectide position 165 in exon 6 of the bovine PIT-1 gene CC with HinfI, separating the resulting fragments, and ascertaining the term of the term of the primers are used to amplify the bovine PIT-1 gene CC pri-1 gene. These primers are used to amplify the bovine PIT-1 gene CC performed to detect an 800 bp fragment length polymorphism analysis is performed to detect an 800 bp fragment [indicating absence of a HinfI CC CC attle with the genotype are selected for breeding. The genotype CC lacking the HinfI site is associated with an average 13.2% increase in calk production and an average 11.2% increase in total protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

CC The sequence is that encoding a protein which can be used in the CC proteins BARDI, B123, BE2, BE14, BE31 or BE445, or a composition for the CC groteins BARDI, B123, BE2, BE14, BE31 or BE445, or a composition for the CC sequence, specifically a wild type BARDI composition for the CC risk of developing cancer. BARDI can be used in the preparation of an CC anti-BARDI antibody, and in the detection and purification of a BRCA1, BE31 or BE445 can used in the preparation of a BRCA1 binding protein agonist or antagonist that alters identification of a binding protein agonist or antagonist that alters CC identification of a binding protein agonist or antagonist that alters CC biological activity of the BRCA1-BARDI al23, BE2, BE14, BE31 or BE445 to BRCA1 or BE445 can used in the BE31 or BE445, a specific anti-BARDI, B123, BE2, BE14, BE31 or BE445, BE31 or BE445 can used to identify BE31 or BE445, a specific anti-BARDI antibody can be used to identify CC a patient having or at risk of developing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human immunomodulatory poly:peptide(s) - have homology to the yeast RAD50 or Drosophila Septin-2 proteins
Disclosure: Page 64: 155pp: English.
V59981-89 represent mulitple isoforms of a human homologue of the rat brain long chain acyl-CoA synthetase. The present sequence has 90% overall homology to the rat gene, and is expressed in activated T-cells, testis, and foetal liver tissues. The specification also describes sequences encoding human homologues of the yeast RAD50, the Drosophila Septin-2 and Acyl-CoA synthetase. The proteins have immunomodulatory activity. The nucleic acids and proteins can be used to identify activated T-cells in a sample population. They can also be used to isolate and identify sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dolganov

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 28-30; 51pp; English.

Claim 1; Page 28-30; 51pp; English.

Chaperone Firsy (W11328), which can be used to increase secretion of chaperone Firsy (W11328), which can be used to increase secretion of overexpressed proteins (homologous or heterologous) from Gram-

Compositive (esp. Bacillus) hosts. To isolate the gene, degenerate princers (see also T51351-53) were synthesized making use of existing the compositive (esp. Bacillus) hosts. To isolate the gene, degenerate compositive (esp. Bacillus) hosts. To isolate the gene, degenerate compositive (see also T1351-53) were synthesized making use of existing the composition of inversed PCR using a 110 bp fragment, which was composited from a nested PCR, a 4 kb fragment (see also 51356) was considered that included the firsy coding sequence. The gene can be concorporated into a recombinant vector pref. also conty, regulatory celements and opt. the gene encoding the protein of interest. By cleading the overexpressed protein into the secretion pathway, the composition and makes possible continuous culture and prodn. Sequence 1016 Bp; 346 A; 182 C; 252 G; 236 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fusion protein of CTLA4 and immunoglobulin fragment - for treating immune system disorders
Example 8: Fig 26: 75pp; English.
This represents a nucleic acid sequence encoding a CTLA4-ova fusion protein. The invention provides a CTLA4-Ig fusion protein that binds the B7 antigen and has a first amino acid sequence consisting of the extracellular domain of CTLA4 and a second amino acid sequence consisting of the hinge, CH2 and CH3 regions of a human immunoglobulin molecule. The fusion protein inhibits interaction of T cells with B7-positive cells and may be useful for treating immune system diseases, e.g. autoimmune diseases, cancer or viral infections. The fusion protein encoded by the present sequence is an example of a soluble fusion protein and contains an amino-terminal CTLA4 domain and an ovalbumin carboxy-terminal domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus pneumoniae tryptophanyl tRNA synthetase - useful to pridentify drugs and raise antibodies for protection and diagnosis of streptococcal infection

PS Claim 4; Pages 8-9; 43pp; English.

Claim 4; Pages 8-9; 43pp; English.

CThe present sequence encodes a tryptophanyl tRNA synthetase (trpS) of streptococcus pneumoniae sp. 010093. This trpS is structurally related to other proteins of the tryptophanyl tRNA synthetase family. The protein exhibite greatest homology to Clostridium longisporum tryptophanyl tRNA competitive binding assays inhibit or activate trpS can be identified by competitive binding assays inhibit or activate trpS can be identified by competitive binding assays involving contact with the trpS protein. Antagonists can be used for treatment where inhibition of trpS is required. Disease related to trpS can be determined by determining the presence of nucleic acids encoding trpS in samples. TrpS can also be used to generate an immunological response in a mammal, by inoculation of trpS, adequate to produce antibody and/or T cell immune response to protect against disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA sequence includes an open reading frame encoding porcine interferon beta-1 (see W83903). The invention provides bowine, murine, porcine, feline, laprine and rat mature alpha, beta and gamma interferons and their propeptides (see W83895-905, W83918 and W70582-85). Recombinant DNA methods can be utilised to prepare these non-human animal interferons in amounts sufficient to enable the determination of their biochemical properties and bioactivities, and hence to allow efficient production for commercial or biological and hence to allow efficient production for commercial or biological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             င္မ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence appears in the specification, but no further CC information is provided. The specification describes the production of CC artificial chromosomes. Artificial chromosomes can be produced by CC incorporating a DNA fragment comprising a selectable marker into a CC cells' genomic DNA, into or adjacent to an amplifiable region, and CC selecting a cell that comprises either a satellite artificial CC chromosome (8ATAC) (e.g. v04903-09), a de novo centromere, or a CC minichromosome (8ATAC) (e.g. v04903-09), a de novo centromere or a extra CC genomic locus for targeted integration of megabase size DNA fragments CC that contain single or multiple genes. SATACs can be introduced into CC embryonic cells of non-human animals to produce transgenic animals that corporate a heterologous DNA encoding a therapeutic product, e.g. anti-HIV. CT The DNA may also encode antigens that induce immunoprotective response CC gainst pathogen. These therapeutic products can be used in gene therapy. The artificial chromosomes are useful as cloning vehicles that accommodate entire genomes for the preparation of genomic DNA libraries, CC and also for the production of proteins which may be involved in a CC biochemical pathway or in multivalent vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          porcine, feline and rabbit mature interferons and their propeptide (see W73224-35). Recombinant DNA methods can be used to prepare these non-human animal interferons in amounts sufficient to enable the determination of their biochemical properties and bloactivities, and hence to allow efficient production for commercial or biological exploitation. Interferons are useful as antiviral and antitumour agents. A replicable expression vehicle comprising claimed non-human animal interferon nucleic acid, a process for producing such an interferon, and a microorganism (especially Escherichia coll) or cell culture transfected with the nucleic acid are claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-APR-1998 (first entry)

Nucleic acid sequence of the specification.

CC The present sequence encodes the alpha subunit of phenylalanyl trNA CC The polyniclectide encoding phes can be used for the recombinant CC production of phes, which can be used to treat conditions requiring phes CC control phes expression. Phes, or phes expressing vectors can be used to thirty. Sequences antisense to the polyniclectide can be used to conduct an immune response, i.e. an antibody (Ab) and/or T cell response, CC antivity, i.e. antibacterials. The antagonist, e.g. an anti-phes ab, can used to treat conditions requiring phes inhibition, e.g. an colling to the polyniclectide encoding phes or phes's concent for the polyniclectide encoding phes or phes's concent for the polyniclectide encoding phes and the polyniclectide encoding phes or phes's concent for the polyniclectide encoding phes and the polyniclectide encoding phes or phes's concent for the polyniclectide encoding phes and the phes can used as a probe to isolate full length correlated sequences, or diagnose, e.g. by polymerase chain reaction. CC e.g. by immunoassay. The Ab can used as a probe to isolate full length correlated sequences, or diagnose, e.g. by polymerase chain reaction. CC e.g. by immunoassay. The Ab can used to treat infection, isolate or claentify phes expressing clones, purify phes and as an immunoassay of mammalian cells and block the normal progression of infection. rigand for the CD40 receptor, causing proliferation and differentiation of B cells and some cancer cells PS Disclosure; Fig 9; 39pp; English.

CC The complete nucleic acid sequence of human gp39 (hgp39) protein CC (corresp. to cDNA) and the complete Ax sequence of hgp39 are CC presented in 057984 and R49548 respectively and contd. in plasmid CC CDM8-hgp39, deposited with the ATCC as E. coli, CDM8 Mc1061/p3-hgp39 CC and assigned accession No. 69050. The human T cell antigen gp39 is a CC ligand for the CD40 receptor. Soluble gp39 may be produced using the expression vector CD8-gp39. Chimeric genes may be constructed by GC fusing sequences encoding the extracellular domains of gp39 and CD8, pref. murine or human CD8 protein. Plasmid p3-shgp39 encoding the fusion protein of the extracellular domains from gp39 and CD8 pref. murine or human CD8 protein. Plasmid p3-shgp39 encoding the fusion protein of the extracellular domains from gp39 and CD8 Sequence 1060 BP; 196 A; 349 C; 204 C
     T coleopterans

PS Claim 4; Pages 201-202; 483pp; English.

CC This sequence encodes a Streptococcus pneumoniae protein that (based on CC homology with a Lactococcus lactis protein) is an anthranilate synthase CC component, and represents a DNA sequence of the invention.

CC 1010933 (NCIMB 40794). The Streptococcus pneumoniae proteins of the CC invention can be used to identify compounds which interact with and CC inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic cimmunisation. They can also be used to induce an immunological response consistation with the S. pneumoniae proteins or delivery CC of the encoding nucleic acids in a vector adequate to produce antibody CC and/or T cell immune responses to protect the animal from disease. The CC capable of inhibiting their bioactivity antimicrobial compounds which are CC capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian CC invention can be used to prevent adhesion of bacteria to mammalian CC progression of pathogenesis in infections initiated other than by the CC implantation of in-dwelling devices or other surgical techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  片
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pri Manmalian USCE2A catalyses covalent attachment of ubiquitin to E2A - pri inhibitors of which can be used to inhibit proliferation of cell pri that express transcription factor E2A

PS Claim 7; Page 47; 69pp; English.

CC This sequence represents the coding sequence for the rat UBCE2A cubiquitin conjugating enzyme) of the invention. The encoded protein catalyses the covalent attachment of ubiquitin to E2A. An anti-UBCE2A cantibody or a single stranded nucleic acid that is antisense to a portion of this sequence that reduces the level of UBCE2A biological activity in catalyses the used to inhibit the proliferation of a cell that expresses transcription factor E2A. The proliferation of a cell that expresses can inhibited by introducing a proteasome inhibitor into the cell or by introducing a proteasome inhibitor into the cell or cativator activity of wild type E2A but lacks the UBCE2A binding site or cacks at least 1 of the lysine residues which are ubiquitination sites on the wild type E2A.

It was isolated from a human adult brain cDNA library and is designated clone BG142_1. The DNA sequences and encoded polypeptides can be used as nutritional sources or supplements, or may exhibit e.g. cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoissis regulating activity, receptor/ligand activity, anti-inflammatory activity, activity/in/inhibit activity, chemostatic/chemoxinetic activity, cadherin/tumour invasion suppressor activity, tissue growth activity, tumour inhibition activity or other activity.

A composition comprising prolactin or prolactin cDNA can be used for enhancing the immune response of an animal to an infectious disease vaccine. The composition can be used to enhance the effectiveness of vaccines which are considered "weak" e.g. bacterins and
                                                                                                                                                                                                                                                                                                                                                                                                                              T 181

Oligonucleotides 1-6 (Q21017-22) are used in the prodn. of alphalM(aa54-87)-alphalM(aa51-183). The ligated sequences form a 200 bp gene, which is inserted in the HindIII/BamHI pBR322 vector fragment (pBR322-delta-alphalM). The pBR322-delta-alphalM vector insert is then inserted into pVB1/EH to form pVB1/EH-delta-alphalM. Example 2.2 describes the prod. of galactose binding protein(aa1-306) application of the production of the protein pVB1/EH-delta-alphalM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human influenza-A virus haemagglutinin polypeptide(s) - useful in influenza-A vaccine composition Claim 17; Page 59; 68pp; English.

This sequence encodes the stem region of the hemagglutinin (HA) molecule of the A2/Aichi/2/68 strain of human influenza A virus. This antigenim molecule contains the conserved peptides derived from the stem region of the HINI and HZNZ subtypes of human influenza A virus. Immunogenic polypeptides such as this are antigenically equivalent to the stem region the HA molecule of influenza A virus. This artificial peptide may used as a vaccine for prophylaxis of influenza A virus infection.

The present sequence encodes a sugar kinase of Staphylococcus aureus WCUH 29 strain NCIMB 40771. The specification describes products, compositions and methods for assessing staphylococcal sugar kinase expression, diagnosing and treating disease, e.g. infections of the upper respiratory tract, lower respiratory tract, heart, gastrointestinal tract, CNS, kidney and urinary tract, skin, bone and joint. The protein and nucleic acid may also be used to induce an immunological response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnosis; treatment; disease; infection; upper respiratory tract; lower respiratory tract; heart; gastrointestinal tract; CNS; kidney; urinary tract; skin; bone; joint; induce; immunological response; ds
                                                                                                                                         Human MutTs2 polypeptide - useful for hydrolysis and elimination of oxidised guanine nucleotide(s) to ensure correct DNA synthesis Claim 1; Figure 1; Sapp; English.

Mutated human MutT2 is implicated in diseases which are related to errors in DNA replication e.g. such as those which lead to tumours and cancers. Provision of wild type hmutT2 (especially by gene therapy) to patients allows oxidised guanine nucleotides to be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T 184

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T66409;
                                                                                                                     Example 3; Page 8-9; 15pp; Japanese. This sequence encodes the human decay accelerating factor (DAF) protein. DAF can be used in the viral vector of the invention. The viral vector contains a factor controlling the function of a human complement protein.
                                                                                                                                                                                                                                                                                                                                                                                                   DAF protein coding sequence.

Fumour cell transfected to express B7-2 molecule - useful for tumour therapy by stimulating T-cell response placiosure; Column 31-34; 27pp; English.

This sequence encodes the mouse B7-2 antigen, which can be used in the method of the invention. The method is for transfecting an isolated mammalian tumour cell with an exogenous nucleic acid molecule encoding a mammalian B7-2 molecule, where the B7-2 molecule is expressed in the tumour cell is capable of costimulating a T-cell and is capable of binding a CD38 or CTLA4 ligand. The method is useful for treating tumours by stimulating a T-cell response against tumour cells in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C s. pneumoniae. Its encoded protein, or agonists of it,

S. pneumoniae. Its encoded protein or agonists of it,

S. pneumoniae. Its encoded protein or agonists of it,

c may be useful as an antibacterial for treatment or

c prevention of infection, specifically caused by S. pneumoniae

(c prevention of infection, specifically also Helicobacter

pylori (ulcers and gastric cancer). It may be of particular

(use before insertion of an in-dwelling device or any other

(c invasive procedure. The protein, or nucleic acid encoding

(it, can also be used in vaccines to induce a cellular

and/or humoral immune response, or to screen for other

(antibacterials. The DNA may also contain flanking sequences

that are potential sources of control elements for bacterial

gene expression. Detecting a sequence encoding the protein

c can be used diagnostically, e.g. to detect a mutation for

serotyping or classifying infectious agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RNA from activated M12 cells (a murine B cell tumour line).

COS cells were transfected with the M12 murine B cell library.

CDNA and screened for expression of B7-2. 6 clones were strongly positive. The B7-2 cDNA insert in clone 4 was sequenced in the positive. The B7-2 cDNA insert in clone 4 was sequenced in the positive. The B7-2 cDNA insert in clone 4 was sequenced in the positive. The B7-2 cDNA insert in clone 4 was sequenced in the positive common vector employing the following strategy. Initial sequencing was performed using sequencing primers T7 (081352) and common contains sequence obtd. Using these primers was used to design additional sequencing primers (see 081367-081370). The cycle cof sequencing and selection of additional primers was continued until the murine B7-2 cDNA was completely sequenced on both strands. A murine B7-2 cDNA was completely sequenced on both strands. A murine B7-2 cDNA was completely sequenced on both of the signal peptide would result in a murine B7-2 membrane bound protein having an unmodified mol. wt. of approx. 32 kDa. The extracellular domain contains nine potential N-11nked glycosylation sites. Glycosylation may increase the mol. wt. to about 50-70 kDa.

                                                                                                                                                                                                                                                                                                                  Monoclonal antibody against recombinant II-8 receptor polypeptide -
yr useful for treating inflammatory disorders, for detecting
neutrophil(s) and for isolating II-8 receptor from liq.mixt.

Disclosure; Fig 2A-B; 74pp; English.

Monoclonal antibodies were raised against recombinant interleukin-8
(II-8) receptor subtypes A and B from both human and rabbit sources
(R80950-53 encoded by 099949-52). The A subtype receptor (II-8rA) is a
low affinity receptor and the B subtype receptor (II-8rB) is a
low affinity receptor. The monoclonal antibody (mab) pref. binds to
the II-8 binding domain thus blocking its activation. The mabs are
useful for treating inflammatory disorders (see key words) and for
detecting the presence of neutrophils in a biological sample. The
mabs are also useful in the isolation of II-8 receptors from a mixture.

The pauA gene was amplified from S. uberis strain c216 chromosomal DNA using probes (see V84166-68) based on cisolated peptides of PauA and by screening of transformant libraries for clearing activity on skim milk plates. A pauA gene was also isolated from S. uberis strain 95-140 (see V84164). The pauA polypeptides are useful for recombinant production of PauA polypeptides. They are also useful for designing diagnostic primers and probes for detection of bacterial disease, including mastitis-causing streptococci, particularly S. uberis, by amplification and detection of pauA polypucleotides (claimed). The PauA polypeptides are useful as vaccines to protect mammals against mastitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inlium perenne Lol pv and Dactylis glomerata Dac gV epitope(s) and DNA - for treating sensitivity to rye-grass pollen allergen or an immunologically cross-reactive allergen.

Example 5; Page 73-74; 110pp; English.

Example 5; Page 73-74; 110pp; English.

This is the cDNA sequence of clone 259, encoding Dac gV derived from a lambda gt10 library. The nucleotide sequence from 700 to 1181 is only preliminary and some bases may be misidentified (sic). Dac gV, isolated from Dactylis glomerata, is a major protein allergen related to ryegrass pollen allergens, eg. Lol pv. Peptides comprising at least one T cell epitope derived from the Lol pv. protein are claimed, and can be used to treat or diagnose sensitivity to ryegrass pollen in an individual or to pollen proteins that are immunologically related to Lol pv, such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B
                                                                                                                           inhibitors, used for treating e.g. tumours, inflammation or traumatic or ischaemic injury

provided in the treating e.g. tumours, inflammation or traumatic; Page 52; 70pp; English.

A DNA molecule (T62556) codes for human IP-10 (W14307), a 10 kDa conceptor and which is capable of inhibiting endothelial cell proliferation. IP-10 nucleic acids can be used to prepare recombinant IP-10, esp. as a non-aggregating fusion protein with calkaline phosphatase as fusion partner. IP-10, or a nucleic acid cencoding it (provided e.g. by a viral vector), can be used to endotheliomas or arteriosclerosis, and to inhibit fibroblast endotheliomas or arteriosclerosis, and to inhibit fibroblast growth factor or transforming growth factor-beta activity.

Disclosure; Fig 8; 39p; English.

The cDNA encodes a rape (cv. Rafal) protein involved in abscission or dehiscence, and can be used to manipulate plant abscission and reduce/prevent pod dehiscence, especially to regulate abscission or policy from anthers, to generate male sterile plants and for hybric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            31-MAR-1993; GB-00672b.

The present sequence has 90% overall homology to the rat gene, and is expressed in activated T-cells, testis, and foetal liver tissues. The specification also describes sequences encoding human homologues of the yeast RAD50, the Drosophila Septin-2 and Acyl-CoA synthetase. The proteins have immunomodulatory activity. The nucleic acids and proteins can be used to identify activated T-cells in a sample population. They can also be used to isolate and identify sequences
